

Simple Folder Colorizer by YaTools

Simple Folder Colorizer is a lightweight editor extension for Unity that helps you visually organize your project hierarchy by tinting folder icons with custom colors. It supports both grid and list views perfectly without breaking native Unity UI.

Features

- **Custom Presets:** Save and manage your favorite colors.
- **Quick Access:** Keep your most used colors in seven fixed slots and drag any preset into them.
- **Quick Colors on Hold:** Hold the mouse on a folder in the Project window to pick a quick color without opening the tool window.
- **Rainbow:** Paint selected folders with a rainbow gradient using a single button.
- **Recursive Coloring:** Apply colors to a parent folder and automatically color all its subfolders with a single click.
- **Ignore Colored Folders:** Optionally skip folders that already have a color assigned, so repeated paint actions never overwrite existing colors by accident.
- **Undo / Redo:** Changes to colors, presets and quick slots can be reverted with Ctrl+Z (Cmd+Z on macOS).
- **Native Integration:** Fits seamlessly into Unity's Project window (works with grid mode and the left-side folder tree).
- **Dynamic Updates:** Correctly displays hollow icons for empty folders and handles open/closed states.
- **Keyboard Shortcut:** Open the tool instantly with a keyboard shortcut, in addition to the menu and context menu.
- **No Clutter:** Operates entirely in the Editor. It doesn't add any scripts to your game builds.

How to Use

Opening the Tool

1. In the top Unity menu, go to Tools -> YaTools -> Simple Folder Colorizer.
2. Alternatively, right-click in the Project window and select Assets -> YaTools -> Simple Folder Colorizer.
3. Or press Ctrl+Alt+Shift+C (Cmd+Alt+Shift+C on macOS) to open the window from anywhere in the Editor.
4. A floating utility window will appear. You can dock it anywhere in your editor layout.

Note: If the shortcut conflicts with another tool in your project, Unity will prompt you to resolve the conflict. You can rebind it anytime via Edit -> Shortcuts.

Window Overview

- **Top row:** Add a new preset color (+), reset selected folders to the default icon (X), apply a rainbow (rainbow button), and manage presets (Manage Presets...).
- **Quick Access:** Seven slots with your most used colors. Click a slot to paint the selected folders.
- **Color Presets:** Your full color palette. Click a color to paint the selected folders.
- **Additional Settings:** A collapsible section with the Apply to Subfolders, Ignore colored folders and Show quick colors on hold options.

Coloring Folders

5. Select one or multiple folders in your Project window.
6. Click any color in Quick Access or Color Presets.
7. The selected folders will instantly update to the chosen color.

Hover over a color to see its hex code.

Quick Access

- Drag a color from Color Presets onto any Quick Access slot. The slots highlight while you drag.
- To remove a color from a slot, click Manage Presets..., then click the color. Click Done when finished.
- Colors in Quick Access are also shown in the quick color panel that opens when you hold a folder.

Quick Colors on Hold

8. Hold the mouse button on a folder in the Project window.
9. Choose a color from the panel that appears around the cursor, or choose X to reset the folder to the default icon.
10. The folder updates instantly, and you never had to open the tool window.

You can turn this feature off in Additional Settings -> Show quick colors on hold.

Rainbow

11. Select one or more folders.
 12. Click the rainbow button at the top of the window.
- Without Apply to Subfolders, the selected folders are sorted by name and receive evenly spaced colors across the rainbow.
 - With Apply to Subfolders, each selected top-level folder gets its own part of the rainbow, and its subfolders receive shades within that range, so related folders look like a family.
 - With Ignore colored folders, folders that already have a color are skipped.

Applying Colors to Subfolders

13. Open Additional Settings and check Apply to Subfolders.
14. When you apply a color to a folder, all existing subfolders inside it will receive the same color recursively.

Ignoring Already-Colored Folders

15. Open Additional Settings and check Ignore colored folders.
16. When enabled, any folder that already has a color assigned will be skipped during painting, whether it was selected directly or reached through Apply to Subfolders.
17. This is useful when re-coloring a large directory tree: you can paint only the folders that are still uncolored without accidentally overwriting colors you already set elsewhere.

Resetting to Default

18. Select the colored folder(s) you want to revert.
19. Click the X button at the top of the colorizer window to reset them to Unity's default grey folder icon.

Managing Custom Presets

- **Add a new color:** Click the + button, pick a color from the popup window, and click Add Preset.
- **Delete a color:** Click Manage Presets.... The colors will display an X and wiggle when you hover them. Click any color in Color Presets or Quick Access to remove it. Click Done when finished.
- **Undo:** Use Ctrl+Z (Cmd+Z on macOS) to bring back a removed color.

Technical Details & Settings

Where are my colors saved?

The plugin automatically generates a FolderColorSettings.asset file in the same directory as the script. This ScriptableObject stores your presets, Quick Access colors, option states, and the color data for your project's folders (mapped by GUID).

Can I move the plugin folder?

Yes! You can freely move the YaTools folder anywhere in your project. The plugin dynamically locates its settings file.

Moving colored folders

If you move or rename a colored folder, it will keep its color because the plugin uses Unity's internal GUID system. The plugin also includes an automatic cleanup feature that removes leftover data when colored folders are deleted from the project.

Compatibility

Unity 6. Works on Windows, macOS and Linux. Editor-only: nothing is added to your builds.

Thank you for using Simple Folder Colorizer!
